

PSC-MVP-001 Productionization Review Packet

PSC-MVP-001 Productionization Review Packet

This packet surfaces the MVP acceptance contract and operator demo script for Petie-facing internal review. It is a lab-test documentation artifact only. It does not approve production use, customer data, customer migration, public exposure, customer-facing readiness claims, or mutation of any client system.

Source artifact

- Contract: docs/mvp-acceptance-contract-demo-script.md
- Source review commit: 908e51a582c0435aeeba4b919e3b1770715b4da9 (docs: add MVP acceptance contract)
- Current validated checkout: 1fefae0f50117390baedee01d36e07e92c7ebb63
- Existing repo links:
 - README.md links to docs/mvp-acceptance-contract-demo-script.md
 - docs/mvp-test-scope.md links to docs/mvp-acceptance-contract-demo-script.md

Contract validation

Verified the contract exists and contains every required canonical MVP command:

- make mvp-reset
- make mvp-up
- make mvp-seed
- make mvp-demo
- make mvp-audit-verify
- make mvp-denied-controls
- make mvp-acceptance
- make mvp-down

Verified the contract covers every required demo stage:

- clean Docker reset/start
- deterministic seed data

- sample intake/accession
- label artifact
- analysis request lines
- worksheet/batch assignment
- result entry
- review and lock
- COA generation
- COA release
- audit verification
- denied-operation controls
- one-command acceptance
- standard engineering gates

Verified the guardrails are explicit:

- lab-test only
- synthetic data only
- loopback/local Docker only unless a later approved task changes scope
- no Tindall, CENLA, RJ Lee, AmSpec, or other customer data
- no external exposure, reverse proxy, DNS, Authentik, shared hosting, or production deployment
- no production-ready, customer-ready, migration-ready, SENAITE-replacement, or customer-readiness language

Validation run

Validation artifacts were written under `.hermes-validation/t_1b900f7e/`.

Gate	Command	Result	Notes
Contract scan	Python scan of docs/mvp-acceptance-contract-demo-script.md	PASS	Required commands, stages, guardrails present.
Link resolution	README + docs/mvp-test-scope.md link scan	PASS	Both links resolve to the contract file.
Go tests	go test ./...	FAIL	Current checkout has audit/actor-context test expectations ahead of implementation: missing AuditEvent.ActorContext, AuditEvent.TenantID, ValidateAuditEvent, DefaultTenantID; untracked internal/lab/actor_context_test.go also compiles against future API.

Gate	Command	Result	Notes
Go vet	go vet ./...	FAIL	Same current-checkout compile/API mismatch as tests.
Docker/HTTP smoke	make docker-smoke	PASS	Built local Docker app, /healthz returned ok, dev-seed seeded synthetic data, smoke found Clearline Synthetic Lab.
Cleanup	make dev-down; forced removal of stale project-scientist-* test container	PASS	Final docker ps -a --filter name=project-scientist returned empty.

Remaining gates

1. Current branch test/vet failures must be resolved before this repo can claim green engineering gates. The failures are outside the MVP-001 document itself but block overall acceptance.
2. The canonical make mvp-* commands are specified by the contract; they are not yet implemented in the current Makefile. The bootstrap commands remain make dev-reset, make dev-up, make dev-seed, and make docker-smoke.
3. This packet is internal review evidence only. No customer/prod deployment, external exposure, client data, DNS/auth/security/billing changes, or production-readiness claim is authorized.

Accepted language

Project Scientist has a lab-test MVP acceptance contract and operator demo script for a synthetic local Docker-only vertical slice. The contract defines the proof required for sample lifecycle, audit evidence, negative controls, and artifact packet acceptance. It is not approved for customer data, production deployment, migration, or customer-facing readiness claims.
